

Q-tian

A SENSIBLE SCI-FI THRILLER

SAKETH ASHVAPURAM

CHAPTER

1

Location; Planet Q

A thousand stars in the night sky glowed at you when you gazed into the sky. To you, these are just little stars which beautify the sky at night. Our planet is full of mysteries, inventions, technology and a big inexpressible question. What are we? You see, the earth doesn't have the correct date of existence even though scientists are working hard to trace the date of its existence with some tangible clues they have by experimenting on a rock, earth's crust.

As per the scientists' analysis, this universe is about 10-15 billion years old. In contrast, human life existed on earth about 400 million years ago, and civilization developed a few thousand years ago. A puzzle which the human race has struggled to unravel is the existence of the same earthly environment on other planets.

Humans have set one goal, and that goal was to discover other planets and perhaps dominate it. The question they often asked themselves was; does the same climate exist on another planet?

Based on several scientific types of research over the past many centuries they are getting numerous evidence of the existence of earth-like planet and the origin of life in space but yet nothing has been proved.

We are an outcome of evolution. We had history and ancestors. We didn't just crawl out of a dark hole, wipe away the entire human race and took over the earth. No.

The Planet – Q, It's the intersection of our thoughts and experiments, the planet which we imagined existed. It is the only existing planet with a high level of technology and scientific know-how. Scientifically, intellectually and environmentally no other planet can equate with Planet Q.

Species on this remarkable planet, are not weird creatures with long, slimy tongues and tentacles. They don't feed off human blood and nasty looking gnat. The species on the planet are ordinary looking, and they look almost similar to humans on earth except for their glowing skin and remarkably green eyes. The planet which is very close to earth didn't come by accident or fate.

The inhabitants of planet Q are known as Q'tians; they invented a technology to control the temperature around their planet, an artificial way of absorbing carbon dioxide. Though they can see the Moon, there is no night on this planet as the other planets around them, which means the axis of the Q never tilted. They are entirely reigning over their atmosphere; they control the temperature, humidity and make seasons on their wish.

Q'tians never knew fear, they never fight, they don't have any desires, and their only goal is to make their planet have everything they need. However, they do have only one fear; being defeated and their planet being occupied by another planet species. Thus an operation started on planet Q to find out the planets which have the species with the ability to communicate with other planets and to try to defeat them to make Q'tians more powerful in the universe so their planet would be secured. Their experiment on finding the other planets, however, is still in P..R..O..G..R..E..S..S.

Sunlight radiated around the planet, beaming brightly on every roof. It was a hectic time for the Q'tians, so the species were coming and going. The planet had many unique plants and laboratories where vaccines and other essentials were invented. However, something significant and superb was about to go down in the head Lab. It was one of the

most prominent and most equipped laboratories on the Q planet; it was so spacious that it almost resembled a big city on earth. There was an aura around the laboratory as smiles crossed the faces of the busy scientists and their eyes beamed with happiness. Their white lab coats gleamed as they worked.

Each of them had a tiny, black electronic device on their foreheads. This device propagated and received a signal which had a data. They could transmit videos, audio, photos, and any kind of attachment while doing other things at the same time. The Qtian scientists acted like mobile phones because they had internal GPS embedded in their bodies, so their electronic device doesn't need solar or charging because they lived in the solar power 24X7.

There was silence in the laboratory, but their excitement, happy looks, and exaggerated sighs implied that these scientists were on the verge of discovering something magnificent.

Even if they weren't in such a pleasant mood, they wouldn't be able to communicate with one another because Sound Waves could cause a few damages to the artificial environments they had created. They only communicated through signals and telepathy.

A tall, massive man with striking facial features and a headful of wavy brown hair floated into the lab on his grav-

ity board, and all eyes strayed to him. He was the Chief of the Scientists, and he had a commanding presence. Admiration flickered across the faces of the scientists as they looked at him. His jaw tightened, but his eyes were smiling as he held their gazes. He glided around the lab, accessing the progress of each scientist and the way his broad shoulders visibly relaxed told them that he was pleased with what he saw.

He approached the dais and started sending telepathic signals to his peers about their next approach. The decoded message from the Chief says;

"We have finally succeeded in finding another planet which is similar to ours. But we are not sure if the inhabitants of this planet are more powerful or weaker than us. We don't even have a data on knowing how they survive or what their strengths or weaknesses are.

We do not know how they sire their offspring or evolved amongst other things. The only good news is that we've been able to acquire some information about them."

A gigantic electronic screen appeared, the Chief Scientist pinched his forefinger and index finger together, and a slide appeared on the screen. The other scientists riveted on the screen as the information on the human race played. It had a different inscription, the context of the information states;

* They have a natural atmosphere around their planet protecting them from extreme environmental conditions.* They do have a proper amount of sun rays, and their planet axis rotates to give them a day and night.*They do have weak powers at the night time and they are in charge mode.*They also utilize sound waves for communication.

"Now it's time for us to explore more on them, get to know their plans, strengths and defeat them." He said, telepathically.

As he spoke, the scientists were automatically processing and storing his words in their memories, and a few of them had already started searching their internal database for further information. However, the Chief wasn't done speaking, so he went on.

"We can't study on them if we are on their planet, it's difficult for us to survive there for a long time as our abilities haven't gotten to that phase yet and we have lost many brave and courageous scientists who dared to enter the human planet. We will have to create a new species of our kind with triple our metabolism and abilities which will enable it to survive on earth. It will bring a human to us here, and this will help us to study on them. But at the same time humans may not be able to survive here in our environment, so we are going to create a new human with their reproducing techniques and study on him. We will breed our prototype

End of Preview.
